Trichophyton allergy: review of 89 cases.

Palma-Carlos AG, Palma-Carlos ML.

Abstract

A serie of 89 cases (55 men 34 women) of Tricophyton allergy is presented. All the patients had a clinical history and in 86 out of 89 lesions of dermatophytosis urticaria/angioedema was present in 57, eczema in 8, rhinitis in 12, conjunctivitis in 1 and asthma in 12. Skin prick tests to Tricophyton were positive in 53 (59,6%) of the patients and intradermal test in all. Specific IgE was found in 45 (69,3%) out of 70 patients. Antifungal treatment was effective at mean term in 18 cases. Specific immunotherapy was evaluated in 54 with good or very good results in 41 (83,3%). Tricophyton dermatophytosis must be looked for in all the cases of urticaria/angioedema and most cases of respiratory allergy without clear allergy to inhalants.
